PHENYLTRIAZOLE DERIVATIVESDETAILED DESCRIPTION OF INVENTIONTECHNICAL FIELD

The present invention relates to a phenyltriazole derivative which is useful as an active ingredient of pharmaceutical preparations. The phenyltriazole derivative of the present invention has aminobutyric acid receptor (GABA<sub>B</sub> receptor) agonistic activity, and can be used for the prophylaxis and treatment of diseases associated with GABA<sub>B</sub> receptor activity, in particular for the treatment of overactive bladder, urinary incontinence such as urge urinary incontinence, benign prostatic hyperplasia, spasticity and motor control, pain, epilepsy, cognitive defect, psychiatric disorders, alcohol dependence and withdrawal, feeding behaviour, cardiovascular and respiratory disorders.

BACKGROUND ART

GABA<sub>B</sub> receptors are the first example of G protein-coupled receptors where heteromerization of two receptor subtypes has been demonstrated to be necessary for normal function (Jones et al., Nature, (1998) 396, 674- 679); Kaupmann et al., Nature, (1998) 396, 683-687; Kuner et al., Science, (1999) 283, 74-77). Currently there are two GABA<sub>B</sub> receptor subtypes known, GABA<sub>B</sub>R1 and R2. In the brain there are two predominant N terminal splice variants expressed from the GABA<sub>B</sub> R1 gene, GABA<sub>B</sub>R1a and R1b, which heterodimerize with the R2 subunit. Pharmacologically, the different splice forms of GABA<sub>B</sub>R1 could not be distinguished (Kaupmann et al., Nature, (1997) 386, 239-246).

GABA<sub>B</sub> receptors are located throughout the central and peripheral nervous systems (see Ong and Kerr, Life Sciences, (1990) 46, 1489-1501; Bowery et al., Drug Res. (1992) 42(1), 2a, 215-223), and are thus involved in the regulation of a wide variety of neurally-controlled physiological responses, from memory and learning to muscle contraction. This makes the GABA<sub>B</sub> receptor a target for pharmaceutical agents intended to treat central and peripheral neural disorders, and indeed a variety of GABA<sub>B</sub> agonists and antagonists are known and have been proposed for use in therapy including pain, spasticity and motor control, epilepsy, cognitive defects, psychiatric disorders, alcohol dependence and withdrawal, feeding behaviour, cardiovascular and respiratory disorders (Bittiger et al., in GABA: Receptors, Transporters and Metabolism, Tanaka, C., and Bowery, N.G. (Eds). Birkhauser Verlag Basel/Switzerland (1996), 297-305; Bittiger et al., Trends Pharmacol. Sci., 14, 391-394, 1993; Froestl et al., J. Med. Chem., 38, 3297-3312, 1995; Froestl et al., Ibid., 3313-3331).

The GABA<sub>B</sub> receptor agonist baclofen given intrathecally is used clinically for reducing urethral resistance and detrusor overactivity associated with spasticity (Steers et al., *J. Urol.*, 148, 1849-1855, 1992; Mertens et al., *Acta Neurochir.*, 64, 17-25 1995). The main effect of baclofen within the central nervous system is to reduce transmitter release. In the spinal cord it affects the activity of motoneurons and interneurons that are important for micturition and baclofen has previously been reported to have an inhibitory action on rat micturition after intrathecal administration (Igawa et al. *J. Urol.*, 150, 537-542, 1993; Pehrson et al. *J. Urol.*, 168, 2700-2705, 2002).

Taken together, it is suggested that GABA<sub>B</sub> system is involved in the micturition control, both in animals and human. A potent and selective GABA<sub>B</sub> agonist can provide therapeutic benefit in the treatment of urinary bladder dysfunction as well as other indications described above.

GABA<sub>B</sub> agonists are also known to have smooth muscle relaxation action, thus a potent and selective GABA<sub>B</sub> agonist can provide therapeutic benefit in the treatment of BPH.

#### Urinary incontinence

UI is the involuntary loss of urine. UUI is one of the most common types of UI together with stress urinary incontinence (SUI) which is usually caused by a defect in the urethral closure mechanism. UUI is often associated with neurological disorders or diseases causing neuronal damages such as dementia, Parkinson's disease, multiple sclerosis, stroke and diabetes, although it also occurs in individuals with no such disorders. One of the usual causes of UUI is overactive bladder (OAB) which is a medical condition referring to the symptoms of frequency and urgency derived from abnormal contractions and instability of the detrusor muscle.

There are several medications for urinary incontinence on the market today mainly to help treating UUI. Therapy for OAB is focused on drugs that affect peripheral neural control mechanisms or those that act directly on bladder detrusor smooth muscle contraction, with a major emphasis on development of anticholinergic agents. These agents can inhibit the parasympathetic nerves which control bladder voiding or can exert a direct spasmolytic effect on the detrusor muscle of the bladder. This results in a decrease in intravesicular pressure, an increase in capacity and a reduction in the frequency of bladder contraction. Orally active anticholinergic drugs are the most commonly prescribed drugs. However, their most serious drawbacks are unacceptable side effects such as dry mouth, abnormal visions, constipation, and central nervous system disturbances. These side effects lead to poor compliance. Dry mouth symptoms alone are responsible for a 70% non-compliance rate with oxybutynin. The inadequacies of present therapies highlight the need for novel, efficacious, safe, orally available drugs that have fewer side effects.

Benign prostatic hyperplasia (BPH)

BPH is the benign nodular hyperplasia of the periurethral prostate gland commonly seen in men over the age of 50. The overgrowth occurs in the central area of the prostate called the transitional zone, which wraps around the urethra. BPH causes variable degrees of bladder outlet obstruction resulting in progressive lower urinary tract syndromes (LUTS) characterized by urinary frequency, urgency, and nocturia due to incomplete emptying and rapid refilling of the bladder. The actual cause of BPH is unknown but may involve age-related alterations in balance of steroidal sex hormones.

The selective  $\alpha_1$ -adrenoceptor antagonists, such as prazosin, indoramin and tamsulosin are used as an adjunct in the symptomatic treatment of urinary obstruction caused by BPH, although they do not affect on the underlying cause of BPH. In BPH, increased sympathetic tone exacerbates the degree of obstruction of the urethra through contraction of prostatic and urethral smooth muscle. These compounds inhibit sympathetic activity, thereby relaxing the smooth muscle of the urinary tract. Uroselective  $\alpha_1$ -antagonists and  $\alpha_1$ -antagonists with high tissue selectivity for lower urinary tract smooth muscle that do not provoke hypotensive side-effects should be developed for the treatment.

Drugs blocking dihydrotestosterone have been used to reduce the size of the prostate.  $5\alpha$ -reductase inhibitors such as finasteride are prescribed for BPH. These agents selectively inhibit  $5\alpha$ -reductase which mediates conversion of testosterone to dihydrotestosterone, thereby reducing plasma dihydrotestosterone levels and thus prostate growth. The  $5\alpha$ -reductase inhibitors do not bind to androgen receptors and do not affect testosterone levels nor do they possess feminizing side effects.

Androgen receptor antagonists are used for the treatment of prostatic hyperplasia due to excessive action or production of testosterone. Various antiandrogens are under investigation for BPH including chlormadione derivatives with no estrogenic activity, orally-active aromatase inhibitors, luteinizing hormone-releasing hormone (LHRH) analogues.

The dosage regimen with the use of the compounds of the present invention is selected by one of ordinary skill in the arts, in view of a variety of factors, including, without limitation, age, weight, sex, and medical condition of the recipient, the severity of the condition to be treated, the route of administration, the level of metabolic and excretory function of the recipient, the dosage form employed, the particular compound and salt thereof employed.

The compounds of the present invention are preferably formulated prior to administration together with one or more pharmaceutically-acceptable excipients. Excipients are inert substances such as, without limitation carriers, diluents, flavoring agents, sweeteners, lubricants, solubilizers, suspending agents, binders, tablet disintegrating agents and encapsulating material.

Yet another embodiment of the present invention is pharmaceutical formulation comprising a compound of the invention and one or more pharmaceutically-acceptable excipients that are compatible with the other ingredients of the formulation and not deleterious to the recipient thereof. Pharmaceutical formulations of the invention are prepared by combining a therapeutically

effective amount of the compounds of the invention together with one or more pharmaceutically acceptable excipients therefore. In making the compositions of the present invention, the active ingredient may be mixed with a diluent, or enclosed within a carrier, which may be in the form of a capsule, sachet, paper, or other container. The carrier may serve as a diluent, which may be a solid, semi-solid, or liquid material which acts as a vehicle, or can be in the form of tablets, pills, powders, lozenges, elixirs, suspensions, emulsions, solutions, syrups, aerosols, ointment containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions and sterile packaged powders.

For oral administration, the active ingredient may be combined with an oral, and non-toxic pharmaceutically-acceptable carrier, such as, without limitation, lactose, starch, sucrose, glucose, sodium carbonate, mannitol, sorbitol, calcium carbonate, calcium phosphate, calcium sulfate, methyl cellulose, and the like; together with, optionally, disintegrating agents, such as, without limitation, maize, starch, methyl cellulose, agar bentonite, xanthan gum, alginic acid, and the like and optionally, binding agents, for example, without limitation, gelatin, natural sugars, beta lactose, corn sweeteners, natural and synthetic gums, acacia, tragacanth, sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like; and, optionally, lubricating agents, for example, without limitation, magnesium stearate, sodium stearate, stearic acid, sodium oleate, sodium benzoate, sodium acetate, sodium chloride, talc, and the like.

The active ingredient may be mixed with a carrier having binding properties in suitable proportions and compacted in the shape and size desired to produce tablets. The powders and tablets preferably contain from about 1 to about 99 weight percent of the active ingredient which is the novel composition of the present invention. Suitable solid carriers are magnesium carboxymethyl cellulose, low melting waxes, and cocoa butter.

Sterile liquid formulations include suspensions, emulsions, syrups and elixirs. The active ingredient can be dissolved or suspended in a pharmaceutically acceptable carriers, such as sterile water, sterile organic solvent, or a mixture of both sterile water and sterile organic solvent.

The active ingredient can also be dissolved in a suitable organic solvent, for example, aqueous propylene glycol. Other compositions can be made by dispersing the finely divided active ingredient in aqueous starch or sodium carboxymethyl cellulose solution or in a suitable oil.

The formulation may be in unit dosage form, which is a physically discrete unit containing a unit dose, suitable for administration in human or other mammals. A unit dosage form can be a

capsule or tablets, or a number of capsules or tablets. A "unit dose" is a predetermined quantity of the active compound of the present invention, calculated to produce the desired therapeutic effect, in association with one or more excipients. The quantity of active ingredient in a unit dose may be varied or adjusted from about 0.1 to about 1000 milligrams or more according to the particular treatment involved.

Typical oral dosages of the present invention, when used for the indicated effects, will range from about 0.01 mg/kg/day to about 100 mg/kg/day, preferably from 0.1 mg/kg/day to 30 mg/kg/day, and most preferably from about 0.5 mg/kg/day to about 10 mg/kg/day. In the case of parenteral administration, it has generally proven advantageous to administer quantities of about 0.001 to 100mg /kg/day, preferably from 0.01 mg/kg/day to 1 mg/kg/day. The compounds of the present invention may be administered in a single daily dose, or the total daily dose may be administered in divided doses, two, three, or more times per day. Where delivery is via transdermal forms, of course, administration is continuous.

[Measurement of change of intracellular cAMP accumulation by luciferase detection in the human  
20 GABA<sub>B</sub> receptor-transfected HEK293 cell line] (Assay 1)

#### (1) Cloning of GABA<sub>B</sub> receptors and generation of stable cell lines

The human GABA<sub>B(1a)</sub>, GABA<sub>B(1b)</sub> and GABA<sub>B(2)</sub> receptor subunits were cloned into pcDNA3 (Invitrogen) as previously described (White J. H. et al., Nature 1998, 396(6712):679-82). The cell culture and transfection of Human Embryonic Kidney  
25 (HEK293) cells was done as follows. HEK293-Luc cells were grown in Dulbecco's modified Eagle's medium (DMEM, Gibco BRL) supplemented with 5% modified bovine serum (MBS, Gibco BRL) in fibronectin coated 96-well microtiter plates. For transfection (mammalian transfection kit; Stratagene) cells were grown at 20000 cells per well at 35 °C with 3% CO<sub>2</sub> for 24 h with 0.1 ml per well. DNA suspension: 10 µg  
30 expression plasmid DNA of each human GABA<sub>B(1a)</sub> and human GABA<sub>B(2)</sub> in pcDNA3 was dissolved in 450 µl of water with 50 ml CaCl<sub>2</sub> (2.5 M) + 500 µl 2x phosphate

buffered saline (PBS, pH 6.95) and incubated for 10 to 20 min at room temperature. )  
the meantime cell medium was aspirated and cells were washed twice with 200 µl PB  
per well and then 200 µl medium plus 5% MBS was added. For transfection 20 µl c  
suspended DNA was added and incubated for 3 h at 35 °C with 3% CO<sub>2</sub>, cells wer  
5 washed with PBS and 200 µl of growth medium was added and cells were grown for  
days. Cells were then trypsinized and diluted 1:10 in fibronectin coated wells an  
incubated with growth medium supplemented with 1 mg/ml G418 (Gibco BRL) an  
grown under selection pressure for 10 days with 2-3 medium changes. After G41  
selection cells were grown until colonies had formed.

10 (2) Folskolin-stimulated luciferase-reporter gene assay

GABA<sub>B(1b/2)</sub>-HEK293/CRE-luc cells were seeded into poly-D-lysine-coated 384-well  
white/opaque plates (BD BIOCOAT) at 4000 cells/well in 40 µl DMEM/F12 medium  
supplemented with 2.5% FBS, and grown for 48 hours at 37 in a humidified atmosphere  
with 5% CO<sub>2</sub>. Test compounds dissolved in DMSO were diluted into DMEM/F12 medium  
15 containing 0.1% BSA and transferred to the test cultures at 5 µl/well. 10 minutes after the  
test compound addition, forskolin prepared in a manner similar to the test compounds was  
added at 5 µl/well (1.6 µM of final concentration), and cells were then incubated for 3  
hours at 37 in 5% CO<sub>2</sub>. After the incubation, the medium was discarded, followed by  
addition of 20 µl/well of 1:1 mixture of Steady-Glo™ reagent (Promega) and Phenol-red  
20 free DMEM/F12 medium. The plates were incubated at least 5 minutes to ensure complete  
cell lysis and then luciferase activity was measured with ViewLux microplate imager  
(Perkin Elmer).

[Measurement of rhythmic bladder contraction in anesthetized rats] (Assay 2)

(1) Animals

25 Female Sprague-Dawley rats (200~250 g / Charles River Japan) were used.

(2) Rhythmic bladder contraction in anesthetized rats

Rats were anesthetized by intraperitoneal administration of urethane (Sigma) at 1.25 g/kg.  
The trachea was cannulated with a polyethylene tube (HIBIKI, No.8) to facilitate  
respiration; and a cannula (BECTON DICKINSON, PE-50) was placed in the left femoral  
30 vein for intravenous administration of testing compounds. The abdomen was opened  
through a midline incision, and after both ureters were cut, a water-filled balloon (about 1

ml capacity) was inserted through the apex of the bladder dome. The balloon was connected to a pressure transducer onto a polygraph. Rhythmic bladder contraction was elicited by raising up intravesical pressure to approximately 15 cm H<sub>2</sub>O. After the rhythmic bladder contraction was stable, a testing compound was administered intravenously. Activity was estimated by measuring disappearance time and amplitude of the rhythmic bladder contraction. The effect on amplitude of bladder contractions was expressed as a percent suppression of the amplitude of those after the disappearance was recovered. Experimental values were expressed as the mean±S.E.M. The testing compounds-mediated inhibition of the rhythmic bladder contraction was evaluated using Student's t-test. A probability level less than 5% was accepted as significant difference.

Results in folskolin-stimulated luciferase-reporter gene assay (Assay 1) are shown in Examples and tables of the Examples below. For practical reasons, the compounds are grouped in four classes based on activity as follows:

$$IC_{50} = A (< \text{or } =) 0.1 \mu\text{M} < B (< \text{or } =) 0.5 \mu\text{M} < C (< \text{or } =) 1 \mu\text{M} < D$$

The compounds of the present invention also show excellent selectivity, and strong activity in other assays 2 described above.

Z used in Melting point in the following section indicates decomposition.

The resulting residue was purified by silica gel column chromatography (eluent: dichloromethane / diethylether = 4 / 1) to provide phenyl(pyridin-3-yl)methanol (1.07 g).  $^1\text{H}$  NMR ( $\text{CDCl}_3-d$ ):  $\delta$  3.85 (1H, s), 5.83 (1H, sz), 7.20-7.37 (6H, m), 7.69 (1H, ddd,  $J = 2.5, 2.5, 7.9\text{ Hz}$ ), 8.38 (1H, dd,  $J = 2.5, 4.8\text{ Hz}$ ), 8.51 (1H, d,  $J = 2.5\text{ Hz}$ ); MS  $m/z$  186 ( $\text{M}+1$ ).

## Method (v')-1

## cyclobutyl(phenyl)methanol

To a solution of cyclobutyl(phenyl)methanone (1.00 g, 6.24 mmol) in methanol was added sodium borohydride (0.315 g, 7.49 mmol) at 0 °C. After the mixture was stirred for 1 hour at 0 °C, water was added and extracted with ethylacetate. The organic layer was dried over MgSO<sub>4</sub>, filtered, and concentrated under reduced pressure to obtain cyclobutyl(phenyl)methanol (1.03 g). <sup>1</sup>H NMR (CDCl<sub>3</sub>-d): δ 1.74-1.88 (4H, t, m), 1.91-2.15 (2H, m), 2.63 (1H, m), 4.57 (1H, d, *J* = 7.9 Hz), 7.23 7.35 (5H, m).

## 10 Method (v)-2

## 1,1'-(chloromethylene)bis(4-chlorobenzene)

To a solution of 4,4'-dichlorobenzhydrol (4.78 g, 18.9 mmol) in dichloromethane (400 mL) was added thionyl chloride (2.81 g, 23.6 mmol) and 1H-benzotriazole (2.81 g, 23.6 mmol) at room temperature. After the mixture was stirred for 10 minutes, it was filtered, and to the filtrate was added water and extracted with dichloromethane. The organic layer was washed with 3% aqueous sodium hydroxide solution, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated under reduced pressure to provide 1,1'-(chloromethylene)bis(4-chlorobenzene) (5.14 g). <sup>1</sup>H NMR (CDCl<sub>3</sub>-d): δ 6.05 (1H, s), 7.26-7.32 (8H, m).

20 In the similar manner as described in Example 1-1 and with the use of intermediates described above, compounds in Example 1-2 to 1-167 as shown in Table 1 were synthesized.

## [Example 2-1]

## Method B

## 3-[3-(2,2-diphenylethyl)-5-(3-fluorophenyl)-4H-1,2,4-triazol-4-yl]benzoic acid

- 5 To solution of ethyl m-aminobenzoate (5.36 g, 32.4 mmol) in tetrahydrofuran (100 mL) was added 1-hydroxybenzotriazole (7.67 g, 56.8 mmol), triethylamine (3.61 g, 35.7 mmol), 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide (10.9 g, 56.8 mmol), and m-fluorobenzoic acid (5.00 g, 35.7 mmol) at room temperature and stirred for 4 hours. After water was added, the mixture was extracted with ethylacetate. The organic layer was washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>,  
 10 filtered, and concentrated under reduced pressure to obtain ethyl 3-[(3-fluorobenzoyl)amino]benzoate.

Next, a mixture of ethyl 3-[(3-fluorobenzoyl)amino]benzoate (1.11 g, 3.86 mmol) and thionyl chloride was heated at 80 °C for 16 hours. After cooled to room temperature, the excess of thionyl chloride was removed under reduced pressure and obtained ethyl 3-[[[1-ethyl-3-(3-dimethylaminopropyl)-5-(3-fluorophenyl)-1,2,4-triazol-4-yl]amino]benzoate  
 15 (1.11 g).

Next, to a solution of ethyl 3-[[[1-ethyl-3-(3-dimethylaminopropyl)-5-(3-fluorophenyl)-1,2,4-triazol-4-yl]amino]benzoate (320 mg, 1.04 mmol) in acetonitrile (5 mL) was added 3,3-diphenylpropanohydrazide (300 mg

1.25 mmol) and the mixture was heated to 90 °C for 16 hours. After having cooled to ambient temperature, the mixture was concentrated under reduced pressure. The obtained residue was purified twice by preparative TLC (eluent: dichloromethane / methanol = 95 / 5 and then with ethylacetate / hexane = 1 / 1) to provide ethyl 3-[3-(2,2-diphenylethyl)-5-(3-fluorophenyl)-4H-1,2,4-triazol-4-yl]benzoate (78.0 mg). <sup>1</sup>H NMR (DMSO-*d*<sub>6</sub>) δ: 1.31 (t, *J*=7.3Hz, 3H), 3.36 (d, *J*=7.6Hz, 2H), 4.32 (q, *J*=7.3Hz, 2H), 4.45 (t, *J*=8.2Hz, 1H), 7.04 (d, *J*=7.9Hz, 1H), 7.08-7.24 (m, 12H), 7.33-7.38 (m, 1H), 7.57-7.59 (m, 1H), 7.68 (t, *J*=1.9Hz, 1H), 7.72 (t, *J*=7.9Hz, 1H), 8.15 (d, *J*=7.9Hz, 1H); *m/z* 492.2 (*M*<sup>+</sup>+1).

To a solution of ethyl 3-[3-(2,2-diphenylethyl)-5-(3-fluorophenyl)-4H-1,2,4-triazol-4-yl]benzoate (72.0 mg, 0.15 mmol) in ethanol (2 mL) was added 1N aqueous sodium hydroxide solution at room temperature and stirred for 16 hours. The mixture was concentrated under reduced pressure, neutralized with 1N HCl aqueous solution, and extracted with ethylacetate. The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated under reduced pressure. The obtained residue was purified by preparative TLC (eluent: dichloromethane / methanol = 95 / 5) to provide 3-[3-(2,2-diphenylethyl)-5-(3-fluorophenyl)-4H-1,2,4-triazol-4-yl]benzoic acid (37.0 mg).
